TITLE: Torch for consumable-electrode argon-arc welding of aluminum alloys

SOURCE: Avtomaticheskaya svarka, no. 1, 1964, 59-60

TOPIC TAGS: welding, argon arc welding, consumable electrode welding, aluminum welding, argon arc welding torch, aluminum alloy welding

ABSTRACT: A new design (see Enclosure 1) argon-arc-welding torch which ensures a better shielding at 500-550-amp currents and is intended for 1.6-3-mm welding wire is described. Its characteristic feature is a gas chamber with a brass 600-700 mesh/cm² gauze 5 which helps to reduce the velocity and turbulence of the gas stream. The torch is also recommended for welding Al and its alloys in He and in He-A mixtures. Orig. art. has: 3 figures.

TITLE: Welding rod SvAMg7

SOURCE: Avtomaticheskaya svarka, no. 12, 1965, 18-21

TOPIC TAGS: aluminum welding, aluminum alloy, welding rod, magnesium containing alloy, weldability / AMg6 aluminum alloy, SvAMg6 welding rod, SvAMg7 welding rod

ABSTRACT: The optimum composition of welding rods for welding of alloy AMg6 was studied. Three different rod compositions were investigated. The choice of the experimental compositions was based on the following formula for the amount of evaporated magnesium during welding:

$$n = \frac{p_0 N_c Q I}{V_0 u_{cs} (P - p_0 N_c)}$$

Here n is the number of moles of the material investigated, p_0 - vapor pressure of pure magnesium, N_c - molar concentration of magnesium in the alloy, Q - flow rate of

Card 1/2

argon in l/min, L - weld length = 10.0 cm, $V_0 = 22.41$, v_{cb} - rate of welding, cm/min, P - vapor pressure of magnesium. The experimental results are summarized in graphs and tables (see Fig. 1). It was found that welding rod SvMg7 is superior to type SvMg6 as far as the mechanical strength of the welds is concerned, but that the tendency towards crack formation in the welded joints is similar for both types of welding rods. The following engineers took part in the development of the welding rods: N. A. Martynova, V. V. Solov'yeva, N. P. Dronova, and B. A. Steblowskiy.

Ignat'yev, V.I. (Engineer) & Zverev, N.I. (Cand.Tech.Sci.)
The flow of dusty gas round a cylinder (Obtekmnye tsilindra
zapylennym gazom.)

Toploenergetika, 1958,
No.3. Pp. 36-40 (USSR)

There are many processes in which dusty gas flows round a cylinder. Of the total number of particles that pass through a cross-sectional area equal to that of the cylinder, but a considerable distance in advance of it, only a proportion reach the surface of the cylinder and the remainder pass by. The ratio of those that touch the cylinder to the total number was determined in this work for various conditions and the distribution of the dust over the surface of the channel of 500×50 mm section. The experimental device consisted of a vertical of 45 hydraulic diameters from the inlet. Flow was always turbulent at the position of the cylinder. The test cylinder was located at those in a boundless flow. The other experimental conditions are described. The tests were carried out with fractions of milled anthracite and metal dust (an alloy of chromium and iron) with specific gravities of 1.655 and 7.3 gram/cm³ respectively. The procedure of separation is described. The characteristics of the fractions in

The flow of dusty gas round a cylinder.

respect of the velocity at which they fly ('pick-up speed') and hydraulic diameter (the diameter of a sphere with same density and pick-up speed) are tabulated. Dust for the tests was poured into a tube and blown into the collector by a strong jet of air from a needle valve. It was shown by special tests that with this method of delivery the suspension broke up into individual dust particles, uniformly distributed over the working section. In order to determine the proportion of dust trapped on the cylinder the cylinder was wrapped round with a ring of cinefilm 10 mm wide smeared with petrolatum, which trapped all the dust particles that touched it. The film was then compared with a transparent scale under a microscope. Various experimental procedures were used and are described. Nine series of tests were made with downward flow, anthracite dust being used in Nos. 1 - 7, and metal dust in Nos. 8 & 9. Speeds of around 2, 4, 12 & 16 m/sec were used with cylinders of 12, 25 & 50 mm diameter. In each series of tests the finest fractions were used first followed by the coarser. The tests were made at room temperature and pressure. When Reynolds number for the particles is less than 0.1 the resistance to the medium acting on the particles is given by the Stokes' formula, and the St criterion defines the motion. When Reynolds number for the particles is greater than 0.1 Stokes' formula is inapplicable and motion is not uniquely governed by the

Card
2/4

The flow of dusty gas round a cylinder.

96-3-10/26

St criterion. Previous authors have given the proportion trapped as a unique fraction of St, usually there was a considerable scatter of points and considerable difference between the general relationships obtained by different authors. This was probably because in the experiments, Reynolds number was not low enough and instead of a unique relationship between the proportion of particles trapped and St there should have been a family of curves. The authors' test results are given in Fig.1. The accuracy of the determinations is such that a family of curves can be plotted. When the particles move in a vertical flow their relative velocity at a distance from the cylinder is practically equal to the speed of pick-up, but the velocity increases near the cylinder. In the majority of tests the Reynolds number was greater than 0.1 even in the part remote from the cylinder. Therefore, in most of the tests the resistance factor according to Stokes' law was not determined. When particles move in a vertical flow their trajectory and the proportion trapped may also depend on gravitational force. To check this point, two additional series of tests were made with anthracite dust and rising air flow at speeds of 2 and 16.6 m/second. In these tests the axial components of inertia and gravity forces were opposed so that if gravitation was important the proportion trapped should be less than in the first series of tests. The results of the tests given in Fig.2. confirm that this was so. This applies even to the

Card 3/4

the flow of dusty gas round a cylinder.

96-3-10/28

finest of particles for which the air speed was far above the pick-up speed. Dimensionless curves of the distribution of trapped dust over the cylinder surface are of quite a different character with upward and downward flow as will be seen from Fig.3. Therefore, gravity has a marked effect on the process. An additional criterion D is introduced that, together with the criterion St, determines the probability of particles hitting the cylinder with a downward flow of air. Fig.6. gives curves of the distribution of trapped dust on the surface of the cylinder with a downward flow of air. There are 7 figures, 1 table and 10 literature references (6 Russian and 4 English)

TITLE: Instrument for measuring the vertical component of an electrostatic field *qm*

SOURCE: AN SSSR. Izvestiya. Fizika atmosfery okeana, v. 1, no. 10, 1965, 1099-1100

TOPIC TAGS: electrostatic field, atmospheric physics, electric measuring instrument

ABSTRACT: The authors describe an electrostatic fluxmeter for measuring the electrostatic field in the atmosphere, which consists of an external sensor and cathode followers, a radio unit, a recorder, and plate and filament rectifiers. The measuring and shielding four-section plates are chrome plated and polished. The reference voltage for the synchronous detector is produced by an auxiliary electrostatic generator. The shielding plates of both generators are rotated at 3000 rpm. The radio unit consists of a three-state amplifier of the main signal, a reference voltage amplifier, and a synchronous detector. The instrument measures the field within 210 V/m over the entire scale at a minimal amplification factor and 57 V/m at a maximal amplification factor. The accuracy of the measurements is ± 1 V/m. The inertia of the flux-

Card 1/2

meter permits recording, practically without distortion, the magnitude and front of variations of the electrostatic field with a duration of 1 sec and amplitude of 10 V/m. The electrostatic fluxmeter was used for prolonged measurements of the field under good weather conditions in 1963—1964. Orig. art. has: 3 figures.

TITLE: Effect of meteor streams on the electrical field of the atmosphere

SOURCE: AN SSSR. Izvestiya. Fizika atmosfory i okeana, v. 2, no. 3, 1966, 316-319

TOPIC TAGS: meteor, atmospheric electricity, electric field

ABSTRACT: Data on measurements of the electrical field of the atmosphere enabled the authors to study the effect of meteor streams on this field. The results of measurements of nine geophysical stations were used. The data on the electrical field of the atmosphere were analyzed by calculating the mean diurnal and mean monthly values of the field from the data of each geophysical station. These values were averaged for the three years of observations (1957-1959). Then the variations of the field, i.e., the differences between the mean diurnal and mean monthly values, were calculated. The calculated values and the change in the number of meteors for all three streams (Perseid, Geminid, and Quadrantid) were compared. The comparison readily showed that the Perseid meteors did not affect the electrical field of the atmosphere. An

UDC: 551.594

Card 1/2

ACC NR: AP6011375

increase of the field during the passage of meteors was noted only for the more powerful streams, such as Geminid and Quadrantid. However, the dispersion of the data did not permit considering this conclusion sufficiently reliable. Therefore the correlation method of analyzing the experimental data was used to elicit the assumed relation between the changes of the electrical field and the number of meteors. The confidence interval was also calculated for each stream. The correlation coefficient-stream intensity curve, for which the 10-min value of the number of meteors was taken, showed that for the most powerful streams the correlation coefficients had essentially positive value. Thus, statistical analysis of the results of the measurements showed with sufficient reliability that powerful meteor streams affect the electrical field of the atmosphere at the level of the earth. A detailed study of the relationship between these two phenomena and an explanation of the mechanism of this relation is needed for the final solution of this problem. Orig. art. has: 1 table and 3 figures.

skhemy stratigr. mezozoyskikh otlozheniy Rus. platformy.
Leningrad, 1956, pp 179-185.

ABSTRACT: Lower Triassic rocks are widespread not only on the
western but also on the eastern slope of the Vyatka
ridge. In drill holes, thicknesses of 245 m have been
measured in these Triassic deposits, but the rocks have
not been included in the stratigraphic sequence as
devised by N. G. Kassin and A. N. Mazarovich. A five-
fold division is proposed for the Triassic deposits.

Card 1/3

The Stratigraphy of the Lower Triassic Deposits (Cont.) 15-57-4-4128

According to the author, each horizon corresponds to a definite sedimentary rhythm and is characterized by a systematic change in facies, a change from sandy-conglomeratic rocks to argillaceous-marly sediments. Fossil groups, mineral associations, etc. are also distinctive. Phyllopoas are found in the lower horizon, molluscs and annelid worms occur in the second. Large cobbles of metamorphic rocks are common in the conglomerates of these horizons. Of the heavy minerals, apatite and picotite begin to appear in the third horizon; and of the light minerals, mica first appears in this same zone. The upper two horizons are characterized by vertebrates. The fifth horizon is found only on the slopes of the Vyatka ridge. Mineralogically, it is characterized by a greater proportion of stable minerals and by less pyroxene. Very well preserved remains of prokoliginid (procolophonid?) are found in this horizon along the Fedorovka River. Traces of erosion or of ancient weathering are found at the contacts between the horizons. The fluctuating movements, which determined the rhythmic pattern of the Lower Triassic sediments, apparently embraced an extensive region in the northeastern Russian platform and should be reflected also in the

TITLE: ~~Stratigraphic Outline of the Tatarian Deposits in~~
The Stratigraphic Outline of the Tatarian Deposits in
the Upper Vyatka Basin (Stratigraficheskaya skhema
tatarskikh otlozheniy basseyna Verkhney Vyatki)

PERIODICAL: Uch. zap. Kazansk. un-ta, 1956, Vol 115, Nr 16, pp 107-
131.

ABSTRACT: The subdivision of the Tatarian stage along the upper
course of the Vyatka River, made by N. G. Kassin
[Geologicheskoye stroyeniye Kirovskoy oblasti. Kirov
(Geological Structure and Stratigraphy of the Kirovskaya
oblast', Kirov) 1941, Nr 20] and subsequently amended
by N. N. Forsh, has a number of shortcomings. In the
first place, the thickness of these deposits, attaining
600 m in this area, was minimized. Neither classifi-
cation considers the clearly rhythmical nature of the

Card 1/3

15-57-4-4120

The Stratigraphic Outline of the Tatarian Deposits (Cont.)

sedimentation, especially characteristic of the deposits in the upper Tatarian substage. For the lower Tatarian substage (236 m thick) the author recognizes two horizons and two formations in each of these, named for the predominant type of rock. The lower boundary of this substage corresponds to the base of series II and the upper boundary to the top of series V of Kassin. These series are characterized by ostracods, and the lowermost and uppermost series by Anthracosia as well. The upper Tatarian substage is divided into four horizons, the lower two being subdivided in turn into three formations and the upper two into two formations each. All the horizons (but not all the formations) are characterized by ostracods, and some by Anthracosia as well. Special geographic terms for these formations have not been chosen and the localities of the type sections are not indicated. A continental climate reigned during lower Tatarian time in the basin of the upper Vyatka River. The water was shallow, and had a high concentration of magnesian and sulfate salts. Toward the end of this interval, sediments were deposited in a basin containing deeper, freshened marine waters. In upper Tatarian time the conditions of sedimentation changed markedly toward continental facies, Card 2/3

15-57-4-4120

The Stratigraphic Outline of the Tatarian Deposits (Cont.)

lacustrine-paludal, and shallow-water marine environments. Detrital material in lower Tatarian time came from the western Ural region, Timan, and the central and northwestern part of the Russian platform. At the beginning of upper Tatarian time, fragmental material from the disintegration and decomposition of volcanic rocks in the Urals and Timan first appeared. The total magnitude of depression in the basin during Tatarian time exceeded 600 m. Six well-defined erosion surfaces are marked in the entire section, corresponding to the number of separate horizons. Each of these corresponds to a systematic rhythm of sediment accumulation from coarse-grained sediments in the lower part to clays and marly-carbonate deposits above. The author notes a definite change in the ostracod fauna in the vertical direction. He furnishes a table to show the distribution of the individual species for the indicated formations.

AUTHOR: Burov, A.S., Ignat'yev, V.N., Ushakov, A.M., Engineers

TITLE: High-Accuracy Pipes (Truby vysokoy tochnosti)

PERIODICAL: Standartizatsiya, 1957, # 5, p 68-70 (USSR)

ABSTRACT: The article presents the generalized results of a study of the work done by Soviet organizations and industrial plants from 1954 to 1957.

Seamless steel pipes for the oil industry as well as for other industry branches are being produced in accordance with standard "ГОСТ 301-50", which prescribes a limited quantity of steel grades and permits considerable dimension tolerances. Since the tolerances are large, the tubular blanks for many parts are thick-walled, and 70 to 80 % of the metal has to be removed by machining. In various branches of industry the machining allowances had to be reduced or, in some cases, machining was abandoned and some plants worked out their own technical specifications. This resulted in a new assortment of pipes, with smaller dimension allowances as well as with higher mechanical properties to eliminate heat treatment. The tube plant "Yuzhnotrubnyy zavod" (in Nikopol') introduced in 1954-

55 a new technology for the production of hot-rolled, high-accuracy pipes. The accuracy of the inner diameter is secured by the use of mandrels with a tolerance of ± 0.2 mm on their outer diameter. Technical conditions for production and acceptance of high-accuracy pipes were worked out (ЧМТВ 4820.54). The dimensions and permissible inaccuracies of these pipes are given in table 1. A comparison with the permissible dimension deviations of the "ГОСТ 301-50" (Table 2) shows that the present equipment of pipe rolling plants, i.e. the automatic mills "140" and "400", can produce hot-rolled pipes with about 1.5 times less inaccuracies in diameter and wall thickness than is permissible by the "ГОСТ".

The Pervoural'skiy Pipe Plant (Pervoural'skiy novotrubnyy zavod) made experiments with cold drawing and cold rolling of high-accuracy pipes with high mechanical properties, using for both, drawing and rolling, pipes of 120 x 10 mm and 120 x 11 mm hot-rolled on a three-roller "40-160" mill with the usual plant technology. After rolling, the pipes were calibrated on a three-roller calibrating mill. Data on the accuracy of pipes rolled on a three-roller mill are not yet available, but in some published works this method is said to give a higher accuracy than rolling on automatic mills. The experiments, at the

Card 2/3

High-Accuracy Pipes

28-5-16/30

Pervoural'skiy plant, as well as other experiments, verified this statement, since the accuracy achieved corresponds to the highest foreign data. In cold rolling on the mill "XNT-75", the deviations of the inner pipe diameters were within a range of 0.27 mm. The curvature of pipes after trueing on a screw press did not exceed 0.5 mm per meter of pipe. The pipes drawn on a 100-ton cold drawing machine, without interpass heat treatment to secure higher mechanical properties, also gave more accuracy than required by the "ГОСТ301-50".

The authors conclude that the "ГОСТ 301-50" for seamless steel pipes must be revised. The new standard should include hot-rolled pipes with tolerances for wall thicknesses of $\pm 8\%$ and for inner diameters of $+ 0.5\%$ and -1.0% ; cold-rolled pipes with high mechanical properties and deviations of outer diameters of $+ 0.4\%$ and $- 0.2\%$, inner diameters $+ 0.3\%$, wall thicknesses $+ 5\%$ and $- 3\%$.

TITLE: A method for trimming a diamond tool in a metallic binder. Class 67,
No. 183094

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 12, 1966, 154-155

TOPIC TAGS: diamond, metal cutting, abrasive

ABSTRACT: This Author Certificate presents a method for trimming a diamond tool in a metallic binder. To prevent damaging and dulling of abrasive grains, the tool to be worked on is connected to the positive pole of a current source. The greased surface of the tool is connected through flat electrodes to the negative pole of the same source (see Fig. 1). This surface receives streams of the electrolyte (for instance, the aqueous solution of sodium chloride) which anodically decomposes the metallic binding so as to make it assume the desired profile of the tool.

TITLE: A study of the viscosity of electro steel smelting slags

PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy, Chernaya metallurgiya, no.4, 1961, 53-58

TEXT: The transfer of silicon and oxygen from metal to slag and vice versa during the smelting of steel in electric arc furnaces with acid lining depends on the activity of the acid slag which in turn depends on its chemical composition and viscosity. As there were no data available on viscosity, the authors determined the viscosity of acid slags obtained during the smelting of steel 35J(35L). Samples of slag were taken at the end of the melt out period at a temperature of 1540°C, at the end of the oxidizing period at 1590°C and before tapping at 1620°C. The chemical composition of the slags varied within the following limits: SiO₂ 37 - 58%, FeO 12 to 45%, MnO 11 to 20%, Al₂O₃ traces - 6%, Cr₂O₃ 0.3 to 1.2%, CaO 0.8 to 11.6% and Mg 0.2 to 1.4%. In addition some synthetic slags (SiO₂ 54 to 68%, CaO 10 to 30%, FeO 1 to 18%, MnO 1 to 18%) were tested. The viscosity was

Card 1/3

A study of the viscosity ...

determined with an electric vibrational viscometer described earlier (Ref.1: G.I.Leskov, G.D.Shevchenko, Zavodskaya laboratoriya, 1956, No.4) which was first calibrated with transformer oil with various additions of colophony. It was established that the viscosity of acid slags increases with increasing silica content (on the average 3 poises per 10% of SiO_2 within a range of 30 to 50% SiO_2). An increase in the lime content of an acid slag, saturated with silica, causes a small decrease in its viscosity (on average 1.0 poise per 10% of CaO in the range 10 to 30% CaO). At a given temperature, the viscosity of slags increases in the course of smelting but decreases if the slag temperature increases during the smelting and thereby the acidic slag becomes reactive before tapping. During the reducing period the viscosity of a basic slag is lower than that of an acid slag. Remelting of slag lowers its viscosity by 25 to 30%. Therefore, on determining the viscosity of works' slag in cooled samples which are subsequently remelted, the influence of remelting should be taken into consideration, i.e. the results obtained should be increased by 25 to 30%. (Abstractor's note: To allow for a decrease in viscosity by 25 to 30%, the correction Card 2/3

TITLE: Material and heat-balance of smelting metallic chromium
in an electric-arc furnace

PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy, Chernaya
metallurgiya, no. 2, 1962, 65 - 72

TEXT: A new method of chromium smelting, cheaper than the
conventional process, had been proposed by the present authors
and the object of the investigation described in the present
paper was to check the efficiency of this process by compiling
its material and heat-balances. The salient feature of the new
process is the elimination from the charge of that portion of
sodium nitrate which is normally used to provide heat required
to ensure correct running of the smelting process and separation
of the slag from the metal. In the new method a portion of
oxides and fluxes constituting the total weight of the charge
is fused in a three-phase electric-arc furnace and serves as a
physical source of heat required in the reducing stage of the
Card 1/8

Material and heat-balance

S/148/62/000/002/003/008
E193/E383

process. The smelting experiments were carried out in a 750 kVA furnace equipped with a magnetite-lined cast-iron melting shaft, provision having been made for insertion of several thermocouples. The temperature of the charge was measured from the moment of ignition of the combustible mixture added to the charge to form a liquid phase. When this had been formed, the furnace electrodes were lowered, current was switched on and the chromium oxide/lime mixture was smelted. The electrodes were then withdrawn and the reducing portion of the charge (chromium oxide and aluminium in the quantity required to reduce both the solid and fused oxides) was introduced into the melt. The composition of the charge, divided into igniting, ore-bearing and reducing portions (denoted by A, C and B, respectively) is given below. (kg):

Card 2/8

Material and heat-balance

S/148/62/000/002/003/008
E193/E383

	A	E	B	Total
Technical chromium oxide (98.23% Cr_2O_3)	200	500	1620	2320
Aluminium grain (97% Al)	76	-	766	842
Lime (85% CaO)	-	200	-	200
Saltpetre (98% NaNO_3)	16	-	-	16

Total ... 292 700 2386 3378 .

The various elements content (in kg) of the charge was:

Chromium	$2320 \times 0.9823 \times \frac{104}{152} = 1558.8;$
Aluminium	$842 \times 0.97 = 816.7;$
Iron	$2320 \times 0.0015 \times \frac{56}{72} + 842 \times 0.0036 = 5.73;$
Silicon	$2320 \times 0.005 \times \frac{28}{60} = 5.42 .$

Card 3/8

Material and heat-balance

S/148/62/000/002/003/008
E193/E383

The 767.8 kg Al used up in the process was made up as follows: 763.3 kg for reducing the chromium oxide, 3.48 kg and 0.92 kg for the reduction of silicon and iron, respectively, and 3.5 kg included in the metal produced. The process yielded 1 456 kg of crude chromium (Cr 99.06%, Si 0.24%, Al 0.24%, Fe 0.41%, C 0.019%, S 0.016%, P 0.007%), equivalent to 91.6% recovery, the degree of utilization of Al being 94.4%. Regarding the heat-balance, the total duration of the process was 1 hour 44 min, of which 1 hour 27 min constituted the smelting stage (with the current switched on) and the remainder represented the duration of the reducing stage. The temperature of the melt was 1 870 °C, the temperature of the process being 2 100 °C. The integrated heat-balance calculated for these conditions was as follows:

Card 4/8

X

Material and heat-balance S/148/62/000/002/003/008
E193/E383

Heat supplied	kcal	%
By exothermic reducing reactions	1861887	70.6
By electrical energy	773245	29.4
<hr/>		
Total	2635132	100.0

Heat consumed	kcal	%
Heat content of the metal	623750	23.64
Heat content of the slag	1269620	48.21
Heat losses	735416	27.91
Unaccounted-for losses	6346	0.24
<hr/>		
Total	2635132	100.0 .

Card 5/8

Y

Material and heat-balance S/148/62/000/002/003/008
E193/E383

The heat-balance for the smelting stage was as follows:

Heat supplied by	kcal	%
Decomposition of saltpetre by aluminium	52496	5.35
Exothermic reaction of aluminium		
reduction of chromium oxide	155981	15.88
Electric arcs	773245	78.76
<hr/>		
Total	981722	100.0

Card 6/8

Material and heat-balance S/148/62/000/002/003/008
E193/E383

Heat consumed	kcal	%
Heat of electric arcs absorbed by the melt	274100	27.9
Heat of electric arcs used up to compensate the heat losses	499145	50.9
Heat of ignition used up to compensate the heat losses	134559	13.7
Heat of ignition absorbed by the slag	73918	7.5
<hr/>		
Total	981722	100.0 ..

It will be seen that only 34.8% of the electrical energy was used up to heat the melt, the remaining 65.2% being used to compensate for heating losses. In spite of this low thermal efficiency, the application of electrical power for melting a portion of chromium oxide made it possible completely to exclude saltpetre from the charge and to reduce the

The technology of aluminothermic smelting of metallic
chromium in an electric arc furnace

PERIODICAL:

Izvestiya vysshikh uchebnykh zavedeniy. Chernaya
metallurgiya, no.5, 1962, 78-85

TEXT:

The following modified technology was investigated:
preliminary melting of a part of the chromium oxide charge with
addition of lime in an electric arc furnace, lifting the
electrodes, adding the remaining part of the charge and finishing
the process in the usual way. A part of the thermal energy is
supplied by the electric arc, thus reducing the consumption of
aluminium and eliminating the need for potassium nitrate (except
for a small amount used for the initial ignition). In addition,
the quality of the metal produced can be improved, since a part
of the carbon present in chromium oxide will become oxidised, so
that metal with a lower C and N content can be obtained. The
experiments were carried out in an open semi-industrial arc

Approximate methods of calculating the residual welding stresses in single-pass contact welding

PERIODICAL:

Referativnyy zhurnal, Mekhanika, no. 3, 1963, 64, abstract 3V462 (Sb. tr. Mosk. inzh.-stroit. in-t, 1962, no. 18, 83-109)

TEXT: The author considers the stress distribution in a plate welded by contact simultaneously along the whole length and the whole section of the seam. Stresses are determined along the thickness (in the layer which is subject to plane deformation) and in a plate in the plane stressed state. A method of accounting for plastic deformations due to welding, based on the method of elastic solutions, is given. The analysis of the solutions obtained shows that the third component of stress, with usual values of heat load and seam finishing area in the case of single-pass welding, is very small and the stressed state in plates can be considered.

Card 1/2

Approximate methods of ...

S/124/63/000/003/061/065
D234/D308

dered as plane. It is pointed out that in the case of sufficient plasticity of the metal in the seams made without defects the internal plastic deformations cannot affect noticeably the strength of the welded joint. In an appendix the author gives an example of design determination of the stressed state produced by the formation of a contact seam in a plate 10 mm thick and 400 mm wide.

TITLE: A method for the preparation of heat-resistant thin-film resistors. Class 21, No. 171044

SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 10, 1965, 48

TOPIC TAGS: heat resistant microresistor, thin film resistor, resistor production

ABSTRACT: This Author Certificate introduces a method for the preparation of heat-resistant thin-film resistors for micro circuits by thermal evaporation of the metallo-silicide alloy on planar heated pyroceramic supports in a vacuum. The method is distinguished by: 1) triple annealing in vacuum of the evaporator carrying the layer of the evaporating alloy at a temperature on the order of 1750C; 2) holding the just sprayed resistor in vacuum for 3 min at a temperature of 340—360C; and 3) final oxidation of the free silicon within the film by atmospheric action. This procedure reduces the scattering of the rated values and increases the stability of the resistor.

TITLE: A Semiautomatic Process of Pressing Cermet Pieces in Single-section and Multisection Dies (Poluavtomaticheskiy protsess pressovaniya metallokeramicheskikh detaley v odnognezdnykh i mnogognezdnykh press-formakh)

PERIODICAL: V sb.: Poroshkovaya metallurgiya. Nr 4, Moscow, 1956, pp 63-68

ABSTRACT: Experience with automatic and semiautomatic dies for pressing pieces from powdered metals (bushings et al.) at a number of machine-building plants [the STZ (Stalingrad Tractor Plant), IGPZ (State Locomotive Plant No. 1), the Tashsel'mash (Tashkent Agricultural Machinery Plant), et al.] has revealed that the use of these dies increases the efficiency of the presses and affords cost advantages. Using semiautomatic multisection dies on existing universal presses was no less economical than using the available automatic presses.

TITLE: Experimental investigation of the system dielectric amplifier - average power motor

SOURCE: Moscow. Inzhenerno-fizicheskiy institut. Avtomatika i telemekhanika, no. 3, 1962. Sistemy upravleniya yadevnymi energeticheskimi ustanovkami, 44-52

TEXT: The authors discuss the results of experimental investigation into the performance of the two-phase asynchronous ДАД-8/300/400 (DAD-8/300/400) motor speed control system using varicon (Seignette salt) dielectric amplifier. In the experiment the control winding of the motor constitutes the load resistance of a push-pull differential dielectric amplifier, consisting of the supply transformer, four working capacitors (two in series in each arm), decoupling resistors and a bias resistor. Each working capacitor consisted of up to 40 parallel connected 8K2-B (VK2-B) varicons. The dynamics of the overall amplifier - motor system was analyzed.

by using the frequency response technique. The dynamical characteristics show that the dielectric amplifier-motor system may be represented either by serial connection of two aperiodic networks or by one oscillating network with damping greater than unity. A system without a center-tapped transformer was also investigated (the motor windings and controlled non-linear capacitors formed a bridge circuit). The input resistance of the amplifiers was found to be equal to that of the varicon insulation ($10^8 - 10^9$ ohms) and power gain equal to $5 \times 10^6 - 10^7$. Conclusion: dielectric amplifiers can be successfully used for the control of output stages of control systems. There are 2 figures.

Atomnaya Energiya i Ratsional'naya Zashchita (Atomic Energy and Antiatomic Defense), by Ye. I. Vorob'yev and U. Ya. Margulis, edited by A. Ignat'yeva, Moscow, In-t San. Prosveshcheniya, 1956, 78 pp (lecturer's aid), from a standard card of the USSR State Library imeni V. I. Lenin, No 358.5)

"A popular discussion of the structure of matter, radioactivity, nuclear reactions, atomic energy, and use of atomic energy. The destructive effect of an atomic explosion, shock wave, and radioactive and light radiation are described together with protective measures. Separate chapters are devoted to first aid for atomic bomb explosion casualties, monitoring, decontamination, and protective shelters. Bibliography (22 titles). Instructions for the lecturer are given at the end of the book." (U)
